

Fish Tape

Run Wire Under Carpet Up To 25 Feet!

Our 25 feet of Stainless Steel Under Carpet Fish Tape (UCT) is intended for running low voltage wiring between carpet and the pad. The metal tape is constructed of a high grade stainless steel, 3/4" wide by 25 ft. long and comes in a durable plastic storage case. A curl on the leading end provides a non-snagging tip to tunnel under carpet to your destination - even over waffle type padding. Both ends have attachment points for wiring or pulling cord.

How to Run Wire Between Carpet and Padding:

- When fishing wire under carpet, always run it between carpet and padding to create a double cushion to protect the wire. Never staple or tape the wire as traffic could create damage to the wire jacket resulting in a short-circuit.
- Insert the rolled-up end of the Under Carpet Tape between the carpet and padding. Then feed the UCT to the wires destination, strip the end of the wire and attach it to the rolled end of the UCT. Feed the UCT back into its case as it brings the wire to you. The rounded end of the UCT is for running over waffle type padding.)
- NOTE: Do not staple or tape the wire; avoid traffic areas. Always review and follow applicable codes and regulations.
